COMPACT

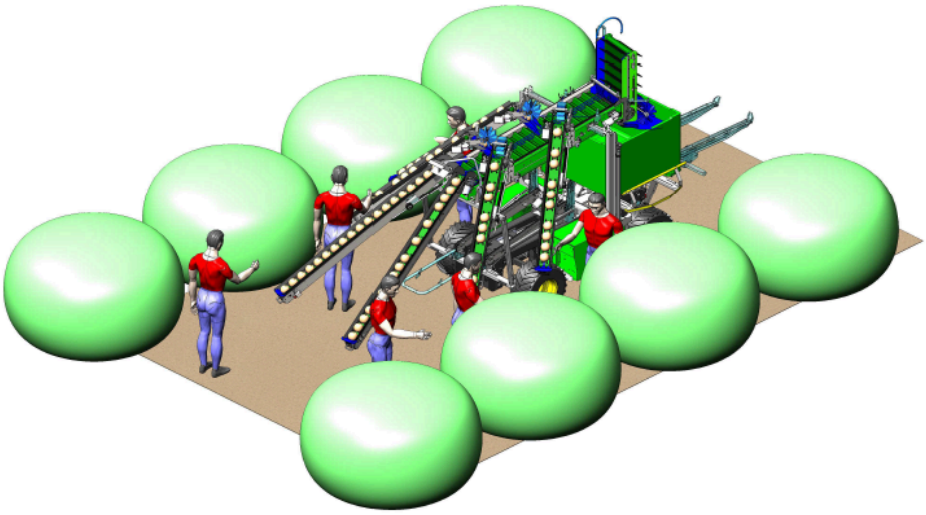
PLATFORM FOR HARVESTING BUSH FRUIT

Our platform, optimised for harvesting bush fruit, is the result of combining the Compact Multiplex modular structure with the Multi-02 harvesting belt system with integrated bin turner, specially configured to meet the needs of low-height crops such as pomegranates.

BASE MULTIPLEX

The Compact Multiplex base is designed to ensure maximum customization. You can choose between 2 or 4 drive wheels, 2 or 4 steering wheels, and add an automatic longitudinal leveling system for improved stability on hilly slopes

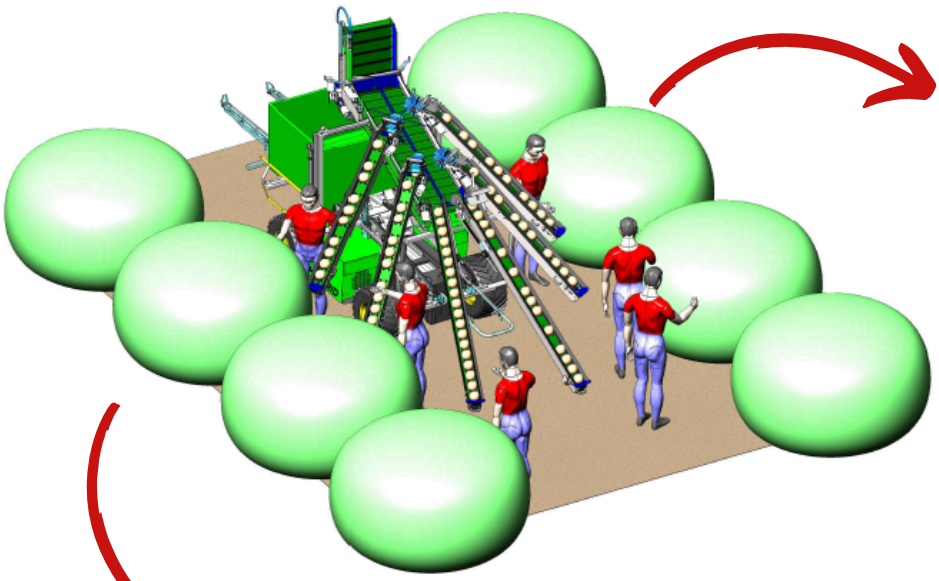


The frame is equipped with a hydraulic compensation system, negative brakes, an electronic differential, and a tight turning radius, allowing operation even in the narrowest spaces

With Compact Multiplex, labor costs are reduced, fruit quality is improved, and operator comfort and safety in the field are enhanced, thanks to a quiet design free of emissions and vibrations

COMPACT

MULTI-02 BELT SYSTEM FOR BUSH FRUIT HARVESTING



Configuration without side platforms: operators work directly from the ground, thanks to the low height of the plants (1.5 m).

Integrated seat for an onboard operator station, ensuring maximum safety for all operators

Extended-length belts, custom-made according to the distance between rows, to ensure effective coverage up to 2.5–2.7 m without compromising the machine's mobility

The bin passes through the base of the machine, without any overhead lifting, ensuring maximum operator safety. Quick bin change can be performed by a single operator in less than 30 seconds.
